

# Definition of done

The parts of our DoD presented in chronological order:

## Design

We start off by discussing architecture, implementation strategies etc. This phase ends by adding the new components to the product backlog.

## Implementation

Using pair-programming, we make sure that all of the newly written code is understood by at least two team members.

## Test

The new functionality is installed on a physical Android device and tested through exploration. Since most of our code needs to be tested on a real device we seldom use the emulator.

## Documentation

When the implementation has been tested, we document everything using javadoc. Wiki updates, code samples etc. are not included in the definition of done.

## Commit

Committing the changes and pushing them to the remote repository on github.

## Code review + refactoring

At the end of the sprint, the team gathers to review the new code. If something could be improved upon, it will be.

## Approval

The finished stories are approved by the product owner.
