Spang Developer guide

Spang is an API which is intended to enable and simplify the communication of data between an android device and a computer. Just include the Spang *jar* in your android project and the Spang *dll* in your windows application project and follow our API documentation.

What you can do

Use the android-side API to

- Connect to an open server
- Send touch data
- Send sensor data
- Send hardware button data
- Send text data

Use the computer-side API to

- Easily access all values transmitted from the sensors
- Interact with the OS (currently only Microsoft Windows™), sending e.g. mouse movement or sound volume change.

What you cannot do

Anything could be possible by adding your own code to the Spang API; the only limit is your creativity.
